3 Chapter 1: Regular Probability Models

Definition 1.1: Regular Parametric Probability Models

- X : $\mathbb{R}$-valued random variable
- F_θ : distribution function of X
- θ : a parameter in $\Theta \subseteq \mathbb{R}^p$ (parameter space)

The probability model $\{F_\theta : \theta \in \Theta\}$ will be calld <u>*regular*</u> if one of the two following conditions holds:

1. $\forall \theta \in \Theta$, the distribution F_θ is continuous with density $f(x;\theta)$
2. $\forall \theta \in \Theta$, the distribution F_θ is discrete with probability mass function $f(x;\theta)$ such that $\sum_{x\in\mathbb{Z}} f(x;\theta) = 1$ for all $\theta \in \Theta$.

- The model F_θ cannot switch between continuous and discrete depending on the value of θ.
- $\mathcal{X} := \{x \in \mathbb{R} : f(x;\theta) > 0\}$ is called the <u>*sample space*</u> of X.

3.1 Discrete Regular Models

Definition 1.5 Binomial distribution
A random variable X is said to follow the binomial distribution with parameters $p \in (0,1)$ and $n \in \mathbb{N}$, denoted $X \sim Binom(n,p)$, if

1. $\mathcal{X} = \{0,\dots,n\}$,
2. $f(x;n,p) = \binom{n}{p} p^x(1-p)^{n-x}$.

- The mean: $\mathbb{E}[X] = np$
- The variance: $Var[X] = np(1-p)$
- The moment genrating function: $M(t) = (1-p+pe^t)^n$

Derivations
The mean:

$$\begin{aligned}
\mathbb{E}[X] &= \sum_{x=0}^{n} x\binom{n}{x}p^x(1-p)^{n-x} &(1)\\
&= \sum_{x=1}^{n} x\binom{n}{x}p^x(1-p)^{n-x} &(2)\\
&= p\sum_{x=1}^{n} x\binom{n}{x}p^{x-1}(1-p)^{n-x} &(3)\\
& &(4)
\end{aligned}$$

Consider the following polynomial's derivative with respect to P

$$\begin{aligned}
(P+Q)^n &= \sum_{x=0}^{n} \binom{n}{x}P^xQ^{n-x} &(5)\\
\frac{\partial}{\partial P}(P+Q)^n &= n(P+Q)^{n-1} = \sum_{x=0}^{n} x\binom{n}{x}P^{x-1}Q^{n-x} &(6)\\
&= \frac{1}{P}\left(\sum_{x=0}^{n} x\binom{n}{x}P^xQ^{n-x}\right) &(7)\\
nP(P+Q)^{n-1} &= \sum_{x=0}^{n} x\binom{n}{x}P^xQ^{n-x} &(8)\\
& &(9)
\end{aligned}$$

Putting $P=p$ and $Q=1-p$, we have

$$\mathbb{E}[X] = pn(p+1-p)^{n-1} = pn \qquad (10)$$

Th vatiance:

$$
\begin{aligned}
Var[X] &= \mathbb{E}[X^2] - \mathbb{E}[X]^2 && (11)\\
&= \sum_{x=0}^{n} x^2 \binom{n}{x} p^x (1-p)^{n-x} - n^2 p^2 && (12)
\end{aligned}
$$

To calculate the first term in the last line, let us consider the following second derivative of the polynomial $(P+Q)^n$

$$
\begin{aligned}
\frac{\partial^2}{\partial P^2}(P+Q)^n &= n(n-1)(P+Q)^{n-2}\\
&= \sum_{x=2}^{n} x(x-1)\binom{n}{x} P^{x-2} Q^{n-x}\\
&= \sum_{x=2}^{n} x^2\binom{n}{x} P^{x-2} Q^{n-x} - \sum_{x=2}^{n} x\binom{n}{x} P^{x-2} Q^{n-x}\\
&= \frac{1}{P^2}\left(\sum_{x=2}^{n} x^2\binom{n}{x} P^{x} Q^{n-x} - \sum_{x=2}^{n} x\binom{n}{x} P^{x} Q^{n-x}\right)\\
&= \frac{1}{P^2}\left(\sum_{x=1}^{n} x^2\binom{n}{x} P^{x} Q^{n-x} - \sum_{x=1}^{n} x\binom{n}{x} P^{x} Q^{n-x}\right)\\
&= \frac{1}{P^2}\left(\sum_{x=1}^{n} x^2\binom{n}{x} P^{x} Q^{n-x} - nP(P+Q)^{n-1}\right)\\
\therefore \sum_{x=1}^{n} x^2\binom{n}{x} P^{x} Q^{n-x} &= n(n-1)P^2(P+Q)^{n-2} + nP(P+Q)^{n-1}
\end{aligned}
$$

Putting $P = p$ and $Q = 1-p$, we have

$$
\sum_{x=0}^{n} x^2\binom{n}{x} p^x (1-p)^{n-x} = n(n-1)p^2 + np \qquad (13)
$$

Hence

$$
Var[X] = n(n-1)p^2 + np - n^2p^2 = np(1-p) \qquad (14)
$$

The moment generating function:

$$
\begin{aligned}
M(t) = \mathbb{E}[e^{tX}] &= \sum_{x=0}^{n} e^{tx}\binom{n}{x} p^x (1-p)^{n-x} && (15)\\
&= \sum_{x=0}^{n} \binom{n}{x} (pe^t)^x (1-p)^{n-x} && (16)\\
&= (1-p+pe^t)^n && (17)
\end{aligned}
$$
