Square Root Difference Theorem

hisanobu-nakamura

1 The Problem

Prove the following statetment: $\forall n, k(>0) \in \mathbb{N}, \exists N \in \mathbb{N}$ such that

$$(\sqrt{n+1} - \sqrt{n})^k = \sqrt{N+1} - \sqrt{N} \tag{1}$$

$$(\sqrt{n+1} - \sqrt{n})^k = \sqrt{N+1} - \sqrt{N}$$
 (2)

Proof

First, let us rephrase the statement in a more tactible way. Take logarithm of the L.H.S.

$$\ln(\sqrt{n+1} - \sqrt{n})^k = k \ln(\frac{1}{\sqrt{n+1} + \sqrt{n}})$$
$$= -k \ln(\sqrt{n+1} + \sqrt{n})$$

Then, with $x=\sqrt{n}$, the logarithm at the last line is equal to $\sinh^{-1}x$. So, let us denote $\phi=-\sinh^{-1}x$. Now, the statement reads that, for ϕ such that $\sinh^2\phi$ is a natural number, prove that $\sinh^2 k\phi$ is also a natural number. In fact, $\sinh k\phi$ can be expressed as a polynomial in terms of $\sinh\phi=\sqrt{n}$ and $\cosh\phi=\sqrt{n+1}$ with integer coefficients. But in order for $\sinh^2 k\phi$ to be natural, $\sinh k\phi$ must factorize into a natural factor and an irrational factor such as $\sinh\phi$, $\cosh\phi$ or $\sinh\phi\cosh\phi$ The trigonometric-hyperbolic conversion rule:

$$\cos i\phi = \cosh \phi, \quad \sin i\phi = i \sinh \phi$$
 (3)

This leads to

$$(x+y)^k = \sum_{l+l'=k} {k \choose l} x^l y^{l'} \tag{4}$$

$$(x+y)^{2m} = x^{2m} + {2m \choose 1} \underline{x^{2m-1}y} + {2m \choose 2} x^{2m-2}y^2 + \cdots + {2m \choose 2m-2} x^2 y^{2m-2} + {2m \choose 2m-1} \underline{xy^{2m-1}} + y^{2m}$$
 (5)

$$(x+y)^{2m+1} = x^{2m+1} + {2m+1 \choose 1} \underline{x^{2m}y} + {2m+1 \choose 2} x^{2m-1}y^2 + \cdots + {2m+1 \choose 2m-1} \underline{x^2y^{2m-1}} + {2m+1 \choose 2m} xy^{2m} + \underline{y^{2m+1}}$$
 (6)
